

Vojtěchová K., Kobrlová L., Schönswitter P. & Duchoslav M. (2023) Disentangling the taxonomic structure of the *Allium paniculatum* species complex in central and eastern Europe using molecular, cytogenetic and morphological tools. – Preslia 95: 119–163.

Supplementary Table S6. – Descriptive statistics of all quantitative characters and their ratios (mean±standard deviation; minimum, 10% and 90% quantile, and maximum) for the taxonomic groups, including common di- and rare triploids recorded in *A. podolicum* and *A. marginatum*. Linear models (LM) with taxonomic category as fixed effect factor, with accounting a different variance in each group, were used for comparison of means of each character among groups, except for one case where Kruskal-Wallis test was applied. Descriptive statistics based on the original (untransformed) values are presented in the table. Bonferroni correction was applied additionally on raw P values and those remaining significant ($P \leq 0.001$) are indicated by boldface. LM were also recalculated with all triploids excluded from taxonomic groups and if any changes in significance of the tests with and without including triploids were detected, they are reported. Bonferroni multiple comparison test was used after a significant result of LM; different letters row-wise indicate significant differences between groups at $P \leq 0.05$. Abbreviations of each character are added before the name of the respective character (first column).

Character	<i>A. fuscum</i>	<i>A. marginatum</i>	<i>A. podolicum</i>	<i>A. paniculatum</i>	F	P
